1.0 Introduction

1.1 Purpose and Objective

Dillon Consulting Limited (Dillon) was retained by 1095 Kingston Road Ltd. C/O Resident to complete a noise and vibration assessment as requested by the Region of Durham for the 1095 Kingston Road proposed development. The proposed development consists of four residential towers, located west of Dixie Road, south of Kingston Road, and north of Highway 401 in Pickering, Ontario. This study has been completed in support of the submission application for the proposed development.

The noise and vibration assessment presented herein was prepared in accordance with the guidelines and requirements of the Region of Durham and the Ontario Ministry of Environment, Conservation and Parks (MECP) noise publication NPC-300. The assessment focuses on noise impacts from the surrounding environment on the proposed development.

The purpose of the noise assessment is to ultimately create a suitable acoustical environment for the protection of residents of the proposed noise sensitive land uses, to protect existing and/or formally approved transportation corridors, and to create compatible land uses and avoid potential adverse effects due to noise.

1.2 The Project and Surrounding Areas

The proposed development is located to the west of Dixie Road, south of Kingston Road, and north of the Highway 401 in Pickering, Ontario. There are commercial businesses and railway lines in the immediate vicinity of the proposed development parcel. Located to the north and west are residential properties, located to the east are commercial businesses, and located to the south are railway lines and the Highway 401. The subject site and surrounding area are shown in **Figure 1**.

Currently, the proposed development land parcel is a commercial plaza. The proposed development consists of four towers that are each 35 storeys.

The land of the proposed development is currently subject to the Kingston Road Corridor and Special Retailing Node Intensification Area and are not subject to the

zoning by-law 3036. Immediately surrounding the proposed development are the following zoned lands:

- North – Residential (S2-DB per by-law 6992/09) and Commercial General (C1 per by-law 6535/05);
- East – Kingston Road Corridor and Special Retailing Node Intensification Area;
- South – Open Space (OS); and
- West – Residential (S2-DB per by-law 6992/09).

The concept plan of the proposed development and zoning map is provided in **Appendix A**.

2.0 Impacts from the Environment on the Proposed Development

A review of the site and surrounding area has been conducted to determine potential stationary noise sources associated with commercial and industrial properties in proximity of the proposed development as well as potential noise impacts from transportation sources (road and rail).

2.1 Stationary Noise

The MECP's land-use compatibility guidelines (D-series) are intended to prevent or minimize the encroachment of sensitive land uses upon industrial/commercial land uses and vice versa, as these two types of land uses are normally incompatible, due to possible adverse effects on the sensitive land use. The guidelines were designed to reduce potential complaints and protect sensitive land uses while upholding the ability of commercial and industrial properties to maintain compliance with MECP requirements.

The D-6 guideline separates industries into three classes based on the scale of the industry's operation. This involves considerations including, but not limited to: probability of fugitive emissions, schedule of operations, and production volume. The D-6 criteria for industry classification are shown in **Appendix B.** The guideline provides setback distances for each class representing potential influence areas and recommended minimum separation distances shown in **Table 1**.

Table 1: D-6 Influence Areas and Recommended Separation Distances

Industrial Class	Potential Influence Area	Recommended Minimum Separation Distance
Class I	70 metres (m)	20 m
Class II	300 m	70 m
Class III	1000 m	300 m

The D-6 guideline specifies that for site-specific plans, measurement shall be from the closest existing, committed, or proposed property/lot line of the industrial land use to the property/lot line of the closest existing, committed, or proposed sensitive land use.

Areas designated for ancillary land uses that are not of a sensitive nature (such as a parking lot) may be included within the separation distance.

When considering vacant industrial land, determination of its potential influence area is based on a hypothetical “worst case scenario” for which the zoned area is committed.

2.2 Nearby Industries

Dillon reviewed the area surrounding the subject lands in order to classify the existing industrial and commercial lands using the MECP’s D-Series framework, as well as to identify nearby vacant lands which are zoned to allow for commercial or industrial uses. Additionally, a site visit was conducted by Dillon personnel on December 3rd, 2024, to identify industrial or commercial operations with the potential influence areas that intersect the proposed development.

Industries were classified based on site visit observations, review of existing MECP approvals documents, and through publicly available information.

Within the study area, the only industry identified with potential for adverse effects on the proposed development was the commercial plaza located at 1099 Kingston Road and approximately 30 m east of the proposed development’s property boundary. Based on observations made during the site visit, the commercial plaza is considered a Class I industry with the potential to have noise impacts on the proposed development.

As per the D-6 Guideline, the proposed development is located within the potential influence area of the commercial plaza. The following sections provide an assessment of the potential noise impacts from the commercial plaza on the proposed development.

2.2.1 Noise Sources

The only potential noise source Dillon identified associated with the commercial plaza were rooftop heating, ventilation, and air conditioning (HVAC) units. Dillon assessed 22 rooftop HVAC units. Conservatively, it was assumed that the rooftop HVAC units operate simultaneously during the daytime and evening period. HVAC units were assumed to run at 50% duty cycle during the nighttime period.

Dillon utilized its in-house library to apply sound power levels to the identified noise sources.

2.2.2 Noise Criteria

NPC-300 defines sound level limits for noise impacts from stationary sources on noise sensitive land uses. A noise sensitive land use is defined as a property of a person that accommodates a dwelling, a noise sensitive commercial purpose, or a noise sensitive institutional purpose. This definition includes:

- Permanent, seasonal, and rental residences;
- Hotels, motels, and campgrounds;
- Schools, universities, libraries, and daycare centres;
- Hospitals and clinics, nursing/retirement homes; and
- Places of worship.

Points of reception (POR) for dwellings are located at the centre of any window on a noise sensitive space, with a first-storey height of 1.5 metre (m) and subsequent storeys separated by 3 m. A dwelling may have an outdoor point of reception located on its property within 30 m of its façade at a height of 1.5 m, typically in back or front yards, terraces, or patios.

In NPC-300, areas are divided into four classes based on their existing background acoustical environment:

- Class 1 – Urban Area;
- Class 2 – Semi-Urban/Semi-Rural Area;
- Class 3 – Rural Area; and
- Class 4 – Areas of Redevelopment and Infill.

The sound level limits for outdoor and plane-of-window PORs for continuous noise, in decibels A-weighted (dBA), are outlined in **Table 2**.

Table 2 Notes

[1] The plane of window for living area or sleeping quarters will be referred to as the "façade" of a receptor.

Table 2: Stationary Source Continuous Noise Exclusionary Limits

Assessment Location	Time of Day	Class 1 Area	Class 2 Area	Class 3 Area	Class 4 Area
Plane of window for living area or sleeping quarters[1]	Daytime (07:00 to 19:00)	50 dBA	50 dBA	45 dBA	60 dBA
	Evening (19:00 to 23:00)	50 dBA	50 dBA	40 dBA	60 dBA
	Nighttime (23:00 to 07:00)	45 dBA	45 dBA	40 dBA	55 dBA
Outdoor points of reception	Daytime (07:00 to 19:00)	50 dBA	50 dBA	45 dBA	55 dBA
	Evening (19:00 to 23:00)	50 dBA	45 dBA	40 dBA	55 dBA

Based on observations made during the site visit completed on October 9, 2024, the existing background acoustical environment of the proposed development's lands are considered Class 1 – Urban Area.

2.2.2.1 Background Sound Levels

In areas that have increased ambient noise due to road traffic, the background sound level may be used as the stationary sound level limit. Due to the proposed development's proximity to Highway 401, transportation noise analysis was completed to determine the background sound levels for the receptors of the proposed development.

The background sound levels due to road noise was determined based on the minimum hourly noise impacts during the daytime, evening, and nighttime periods. Dillon utilized hourly traffic counts over a one-week measurement period for Highway 401 to determine the minimum hourly road noise impacts on the proposed development. Truck percentages for Highway 401 were provided by the Ministry of Transportation Ontario (MTO). Traffic data utilized in this assessment has been provided in **Appendix C**.

The road noise analysis was completed using the STAMSON ORNAMENT protocol. **Table 3** below summarizes the calculated background sound levels for the point of reception of the proposed development with the greatest proximity and exposure to the commercial plaza.

Table 3: Background Sound Levels

Receptor	Time Period	Background Sound Level (1 hour) (dBA)
Tower 2B 8th Storey Podium East Façade	Daytime (07:00 to 19:00)	63
	Evening (19:00 to 23:00)	65
	Nighttime (23:00 to 07:00)	60

The output files used to calculate the background sound levels have been included in **Appendix D**.

2.2.3 Predicted Sound Levels

The stationary noise analysis was completed using CADNA/A, an outdoor noise propagation model, based on International Organization for Standardization (ISO) Standard 9613, Part 1: Calculation of the absorption of sound by the atmosphere, 1993 and Part 2: General method of calculation (ISO-9613-2:1996). The model is capable of incorporating various site-specific features, such as elevation, berms, absorptive grounds, and barriers to accurately predict noise levels at specific receptors, pertaining to noise emissions from a particular source / sources. The ISO based model accounts for reduction in sound level due to increased distance and geometrical spreading, air absorption, ground attenuation, and acoustical shielding by intervening structures and topography. The model is considered conservative as it represents atmospheric conditions that promote propagation of sound from the source to the receiver.

The following assumptions were incorporated in the noise propagation modelling:

- A global ground absorption coefficient of 0.50, representing a mix of reflective and absorptive grounds of the area surrounding the proposed development.
- Second order reflection was incorporated in the noise model; and
- The ground within the study area is considered to be generally flat.

Impacts from the stationary noise sources were predicted through noise propagation modelling. **Table 4** below summarizes the worst-case noise impacts on the façades of the proposed development for continuous noise.

Table 4: Noise Impact Summary Table

Point of Reception	Time Period	Maximum Leq (1 hour) (dBA)	MECP Compliance
Tower 2B 6th Storey Podium East Façade	Daytime (07:00 to 19:00)	54	Compliant with background noise level criteria
	Evening (19:00 to 23:00)	54	Compliant with background noise level criteria
	Nighttime (23:00 to 07:00)	51	Compliant with background noise level criteria

The predicted noise impacts from the commercial plaza on the proposed development have been shown in **Figure 2**. Stationary noise impacts at the remaining points of receptions of the proposed development have been compared against the applicable noise criteria.

The results indicate that the potential noise impacts from the commercial plaza on the proposed development are predicted to be compliance with the MECP's NPC-300.

2.3 Transportation Noise Assessment

The transportation sources identified with the potential to impact the proposed development include vehicular traffic along Kingston Road and the Highway 401 and rail traffic along the Canadian National Railway (CN) York Subdivision, CN Kingston Subdivision, and Metrolinx railways. Impacts from road and rail traffic were predicted and compared against the applicable criteria in the MECP noise guideline publication, **NPC 300 – Environmental Noise Guideline – Stationary and Transportation Sources – Approvals and Planning (2013)**. NPC-300 outlines noise level criteria for sensitive land uses, which assist in determining requirements for façade construction, ventilation requirements, warning clauses, and potential noise barriers for the proposed development.

2.3.1 Noise Criteria

The applicable transportation noise criteria, as outlined in Part C of NPC-300, is summarized below, and presented in **Table 5** through to **Table 9**.

Table 5 summarizes the indoor sound level limits based on the type of space assessed, time of day, and the maximum allowable equivalent sound levels from roadways and railways. The indoor noise levels are based on the assumption of closed windows and doors.

Table 5: Indoor Sound/Level Limits for Road and Rail

Type of Space	Time Period	Equivalent Sound Level - L_{eq} Road	Equivalent Sound Level - L_{eq} Rail
Living/dining areas of residences, hospitals, nursing homes, schools, daycares, etc.	Daytime 07:00 to 23:00	45 dBA	40 dBA
Living/dining areas of residences, hospitals, nursing homes, etc. (except schools and daycares)	Nighttime 23:00 to 07:00	45 dBA	40 dBA
Sleeping quarters of residences	Daytime 07:00 to 23:00	45 dBA	40 dBA
	Nighttime 23:00 to 07:00	40 dBA	35 dBA

Table 6 outlines the maximum equivalent sound levels, from roadway and railway sources, where if exceeded a detailed building component design assessment is required to ensure the indoor sound level limits (see **Table 5**) are achieved.

Table 6: Requirements for Building Component Assessment

Assessment Location	Time Period	Equivalent Sound Level - L_{eq} Road	Equivalent Sound Level - L_{eq} Rail
Plane of window for living area or sleeping quarters	Daytime 07:00 to 23:00	65 dBA	60 dBA
	Nighttime 23:00 to 07:00	60 dBA	55 dBA

As per MECP's NPC-300 Noise Guideline, **Table 7** outlines the façade construction requirements for proposed residential developments within 100 m of rail tracks.

Table 7: Façade Construction Requirement

Assessment Location	Equivalent Sound Level - L_{eq} 24 hour	Façade Construction Requirements
Plane of window for living area or sleeping quarters	> 60 dBA	Brick veneer or acoustical equivalent
	≤ 60 dBA	No requirement

Table 8 summarizes potential noise warning clauses and ventilation requirements that should be used to warn of potential annoyance due to existing noise sources related to transportation.

Table 8: Ventilation and Warning Clause Requirement

Assessment Location	Time Period	Equivalent Sound Level - L_{eq} Road and Rail	Ventilation and Warning Clause Requirements
Plane of window for living area or sleeping quarters	Daytime (07:00 to 23:00)	≤ 55 dBA	No requirement
		> 55 dBA and ≤ 65 dBA	Provision for the installation of central air conditioning with a Type C warning clause
		> 65 dBA	Installation of central air conditioning with a Type D warning clause

Assessment Location	Time Period	Equivalent Sound Level - L_{eq} Road and Rail	Ventilation and Warning Clause Requirements
Plane of window for living area or sleeping quarters	Nighttime (23:00 to 07:00)	≤ 50 dBA	No requirement
		> 50 dBA and ≤ 60 dBA	Provision for the installation of central air conditioning with a Type C warning clause
		> 60 dBA	Installation of central air conditioning with a Type D warning clause

The applicable noise criteria for Outdoor Living Areas (OLAs) specific to surface transportation are presented in **Table 9**. If the 16-Hour Equivalent Sound Level - L_{eq} 16 hour (16h) at an OLA is greater than 55 dBA and less than or equal to 60 dBA, noise control measures may be applied to reduce the sound level to 55 dBA. Otherwise, prospective purchasers or tenants should be informed of potential elevated noise levels by way of warning clause Type A. For a Leq 16h of greater than 60 dBA, noise mitigation measures are required to reduce the noise levels to 55 dBA or less.

Table 9: OLA Level Limits for Road and Rail

Assessment Location	Equivalent Sound Level - L_{eq} 16h Road and Rail	Noise Control Measures and Warning Clause Requirements
Outdoor Living Areas	≤ 55 dBA	No requirement
	> 55 dBA and ≤ 60 dBA	Installation of noise control measures **OR** a Type A warning clause
	> 60 dBA	Installation of noise control measures to reduce noise level to < 55 dBA **OR** Installation of noise control measures to reduce noise level to > 55 dBA and ≤ 60 dBA with a Type B warning clause

2.3.2 Transportation Sources

In assessing potential transportation noise impacts on the proposed development, the following transportation corridors were considered:

- Kingston Road;
- Highway 401;
- CN York Subdivision;
- CN Kingston Subdivision; and
- GO Transit Lakeshore East Subdivision.

2.3.2.1 Road Noise Sources

Road traffic information for Kingston Road was provided by the Regional Municipality of Durham. The provided data included the future forecasted Average Annual Daily Traffic (AADT), the percent of trucks, ratio of heavy to medium trucks, and posted speed. It was assumed that 90% of traffic occurs during the daytime period, and 10% during the nighttime period.

Road traffic information for Highway 401 was provided by the MTO. The provided data included the AADT for the year 2021, the percentage of trucks, and hourly traffic counts for Highway 401 Eastbound Express, Westbound Collector, and Westbound Express. An annual growth rate of 1.8% was determined for this section of the Highway 401 based on 10 years of historical AADTs. Based on the hourly traffic counts, it was determined that 83% of traffic on the Highway 401 occurs during the daytime period and 17% during the nighttime period. Based on the MTO guide for completing noise assessments, it was assumed that 75% of truck traffic is heavy trucks and 25% is medium trucks. Highway 401 traffic volumes were forecasted to the year 2035.

The forecasted future road traffic data is presented in **Table 10**.

Table 10: Future Road Traffic Data

Roadway	Forecasted AADT	Medium Trucks	Heavy Trucks	Speed (kilometers per hour [km/hr])
Kingston Road	35,000	5.6%	2.4%	60
Highway 401	344,684	2.5%	7.5%	100

2.3.2.2 Rail Noise Sources

Dillon requested rail traffic information from Canadian National Railway (CN) for the Kingston Subdivision and York Subdivision. At the time of this assessment, CN has not provided information specific to rail operations in proximity to 1095 Kingston Road. Dillon used historic rail traffic information for the CN Kingston and York Subdivision from a previous project in close proximity to the proposed development.

Rail traffic information for CN Kingston Subdivision was developed using information provided by CN in proximity to 705 Kingston Road. The provided rail traffic information included the number of freights, way freights, and passenger trains travelling on the CN Kingston Subdivision during the daytime and nighttime periods. Additionally, the maximum number of locomotives and cars, and the maximum speed was provided for each train type. CN recommended that a 2.5% annual growth rate be used for forecasting future rail traffic volumes. CN Kingston Subdivision traffic volumes were forecasted to the year 2035.

The volume of trains and train speed for the CN York Subdivision was developed using the Government of Canada's Grade Crossing Inventory. The information provided by CN for the CN Kingston Subdivision was used to determine the locomotives and cars per train, as well as the annual growth rate. It was conservatively assumed that all trains operating on the CN York Subdivision are freights and are equally distributed throughout the daytime and nighttime. CN York Subdivision traffic volumes were forecasted to the year 2035.

Rail traffic information for GO Transit was provided by Metrolinx. They provided rail traffic information including the forecasted diesel and electric GO train volumes, the number of locomotives and cars, and the maximum speed. Metrolinx identified that the use of diesel trains in acoustic modelling is preferred.

The forecasted future rail traffic data is presented in **Table 11** and **Table 12**.

Table 11: Future Rail Traffic Data - Daytime and Evening (07:00 to 23:00)

Rail Operator	Train Type	Locomotives	Cars	Speed (km/h)
CN York Subdivision	Freight	106	3704	80

Rail Operator	Train Type	Locomotives	Cars	Speed (km/h)
CN Kingston Subdivision	Freight	63	2204	105
	Way Freight	0	0	105
	Passenger	89	446	161
GO Transit	Passenger	277	1385	161

Table 12: Future Rail Traffic Data – Nighttime (23:00 to 07:00)

Rail Operator	Train Type	Locomotives	Cars	Speed (km/h)
CN York Subdivision	Freight	53	1852	80
CN Kingston Subdivision	Freight	26	918	105
	Way Freight	21	131	105
	Passenger	3	13	161
GO Transit	Passenger	47	385	161

Based on information received from Metrolinx, anti-whistling bylaws are not in effect for the at-grade crossings in proximity to the proposed development. However, no at-grade crossings were identified within 1 kilometre (km) of the proposed development. Therefore, with the exception of emergency events, train whistle noise is not expected in proximity to the proposed development and was therefore not considered in this assessment.

2.3.3 Predicted Sound Level

The noise analysis was completed using Cadna/A, a noise propagation software. The Cadna/A software includes the implementation of the Transportation Noise Model (TNM) roadway algorithms, as well as the Federal Transit Administration/Federal Railroad Administration (FTA/FRA) railway algorithms. The model is capable of incorporating various site specific features, such as elevation, berms, absorptive grounds, and barriers to accurately predict noise levels at specific receptors, pertaining to noise emissions from a particular noise source. The model accounts for reduction in sound level due to increased distance and geometrical spreading, air absorption, ground attenuation, and acoustical shielding by intervening structures and topography. The model is considered conservative as it represents atmospheric conditions that promote propagation of sound from source to receptor.

Railway Analysis

The railway noise impact assessment was conducted using the FRA algorithm using Cadna/A. The STEAM, utilized through STAMSON Version 5.04 was not used in the assessment due to the complexity of the proposed development and the surrounding area. Based on Dillon's experience using FRA and STEAM in rail noise assessments, the results of the FRA algorithm are within an acceptable range of accuracy.

Roadway Analysis

The assessment for roadway impact noise was completed using the TNM algorithm, developed by the Federal Highway Administration (FHWA), implemented through Cadna/A. The ORNAMENT, utilized through STAMSON Version 5.04 was not used in the assessment due to the complexity of the proposed development and the surrounding area. STAMSON is not capable of incorporating the 3-dimensional components of the proposed development and accurately predicting transportation noise impacts for elevated receptors. Based on Dillon's experience using TNM and ORNAMENT in road noise assessments, the results of the ORNAMENT algorithm are within an acceptable range of accuracy.

Comparative modelling using STAMSON was performed to confirm the accuracy of the TNM protocol. The comparative modelling has been presented in **Section 2.4.**

2.3.3.1 Sensitive Receptor Locations

The site plan of the proposed development was reviewed to identify the location of sensitive receptors. Representative noise receptors were selected for each façade of the buildings of the proposed development and were assessed for transportation noise impacts.

In addition to façade locations, transportation noise impacts were assessed at Outdoor Living Area (OLA) locations. Per NPC-300, common OLAs were assessed at the outdoor amenity areas located on the 7th floor terrace of Tower 1 and the 5th floor terrace of Tower 2.

Additional outdoor amenity areas are located throughout the proposed development, however, it is not expected that the predicted noise impacts on the remaining outdoor amenity areas can be feasibly mitigated with acoustic barriers. The OLAs located on the

7th floor terrace of Tower 1 and the 5th floor terrace of Tower 2 are intended and designed for the quiet enjoyment of the outdoor environment for the occupants of the proposed development.

The locations of the noise receptors assessed in this study has been shown in **Figure 3**.

2.3.3.2 Transportation Noise Impacts – Plane of Window

Table 13 summarizes the predicted building façade noise levels from transportation noise sources at the representative sensitive receptors within the proposed development.

Table 13 Notes

[1] Predicted noise levels that exceed the applicable limits are presented in **bold**.

[2] Tower 2 is greater than 100 m from the nearest rail tracks and does not require facade construction assessment based on 24 hour rail impacts

Table 13: Transportation Noise Prediction Summary Table - Façade Impacts

Receptor	Time Period	Equivalent Sound Level - L_{eq}[1] [dBA] Road Impacts	Equivalent Sound Level - L_{eq}[1] [dBA] Railway Impacts	Equivalent Sound Level - L_{eq}[1] [dBA] Combined Road and Rail	Equivalent Sound Level - L_{eq}[1] [dBA] 24 Hour Rail[2]

The predicted transportation sound levels at the proposed development are presented in **Figure 3**, for daytime impacts.

2.3.3.3 Transportation Noise Impacts – Outdoor Living Areas (OLA)

Table 14 summarizes the worst-case predicted transportation noise levels at the OLAs of the proposed development.

Table 14 Notes

[1] Predicted noise levels that exceed the applicable limits are presented in **bold**.

Table 14: Transportation Noise Prediction Summary Table - OLA Impacts

Tower 1 – 7th Floor OLA	**61**
Tower 2 – 5th Floor OLA	**67**

2.3.4 Noise Control Measures

2.3.4.1 Façade Construction Recommendations

Based on the predicted façade sound levels shown in **Table 13**, and the threshold criteria outlined in **Table 6**, a detailed building component design analysis is required throughout the proposed development to ensure the indoor sound level criteria is met.

Indoor sound levels, and the building component analysis were completed using the National Research Council's (NRC) Building Practice Note 56 (BPN56). BPN56 is the method for selecting appropriate Sound Transmission Class (STC) ratings for the façade and glazing components to control impacts from transportation noise sources, and satisfy indoor sound level criteria.

Results from an initial building component analysis are shown in **Table 15**. As detailed floor plans were not available at the time of this study, typical unit layouts were assumed based on typical high-rise residential units. It was assumed that living/dining spaces had 70% façade glazing and the sleeping quarters had 50% façade glazing. Overall window STC requirements were determined using the combined (logarithmic addition) requirements from the individual transportation noise impacts from

locomotive, wheel, and roadway noise. STC calculations were completed for daytime and nighttime periods, with the worst-case requirement selected for recommendation. The BPN56 analysis is presented in **Appendix E**. It is recommended that the building component analysis is updated as the development design progresses.

Table 15: Building Component Analysis

Building	Required Glazing (STC) Living/Dining Area	Required Glazing (STC) Sleeping Quarters
Tower 1 L2 to L6 North	33	34
Tower 1 L2 to L6 East	39	40
Tower 1 L2 to L6 South	43	43
Tower 1 L7 to L8 North	33	34
Tower 1 L7 to L8 East	39	40
Tower 1 L7 to L8 South	43	44
Tower 1 L7 to L8 West	38	39
Tower 1A L9 to L35 North	34	34
Tower 1A L9 to L35 East	41	42
Tower 1A L9 to L35 South	43	44
Tower 1A L9 to L35 West	38	39
Tower 1B L9 to L35 North	33	34
Tower 1B L9 to L35 East	37	38
Tower 1B L9 to L35 South	40	41
Tower 1B L9 to L35 West	36	37
Tower 2 L2 to L4 North	37	37
Tower 2 L2 to L4 East	32	33
Tower 2 L2 to L4 South	40	40
Tower 2 L2 to L4 West	33	33
Tower 2 L5 to L6 North	34	35
Tower 2 L5 to L6 East	38	39
Tower 2 L5 to L6 South	41	41
Tower 2 L5 to L6 West	34	35

Building	Required Glazing (STC) Living/Dining Area	Required Glazing (STC) Sleeping Quarters
Tower 2A L7 to L35 North	34	34
Tower 2A L7 to L35 East	36	37
Tower 2A L7 to L35 South	35	36
Tower 2A L7 to L35 West	33	33
Tower 2B L7 to L35 North	27	28
Tower 2B L7 to L35 East	39	39
Tower 2B L7 to L35 South	42	43
Tower 2B L7 to L35 West	36	37

The above mentioned STC ratings are conservatively calculated and represent the recommended minimum STC ratings for the windows. Windows should be carefully selected to ensure the entire assembly (frame and glazing) meets the specified minimum STC ratings. It is recommended that manufacturer tests and specifications be reviewed by an Acoustical Consultant upon selection. Sensitive spaces located on corners of buildings, which have multiple façade exposure and potential contribution from multiple sources may require an STC increase of 3.

Additionally, the 24 hour equivalent rail sound level was predicted to be greater than 60 dBA for all sensitive receptors of Tower 1, with the exception of Tower 1 north façade levels 2 to 6, and will require a façade construction of brick veneer or an acoustical equivalent.

As the design progresses, the façade and glazing requirements should by reviewed by an Acoustical Consultant, ideally at the Site Plan Approval (SPA) stage, to confirm or update the above recommended STC ratings.

2.3.4.2 Ventilation Requirements and Warning Clauses

Based on the predicted sound levels shown in **Table 13** and the threshold criteria outlined in **Table 8**, all residential dwellings of the proposed development require the installation of central air conditioning with a Type D warning clause, as outlined below.

Type D Warning Clause: This dwelling unit has been supplied with a central air conditioning system which will allow windows and exterior doors to remain closed, thereby ensuring that the indoor sound levels are within the sound level limits of the Municipality and the Ministry of the Environment.

Additionally, CN and Metrolinx require that a warning clause regarding the potential for noise and vibration impacts be applied to all sensitive locations within 300 metres of their right-of-way.

CN Warning Clause: "Canadian National Railway Company and its assigns or successors in interest has or have a rights-of-way within 1000 metres from the land the subject hereof. There may be alterations to or expansions of the railway facilities on such rights-of-way in the future including the possibility that the railway or its assigns or successors as aforesaid may expand its operations, which expansion may affect the living environment of the residents in the vicinity, notwithstanding the inclusion of any noise and vibration attenuating measures in the design of the development and individual dwelling(s). CN will not be responsible for any complaints or claims arising from use of such facilities and/or operations on, over or under the aforesaid rights-of-way."

Metrolinx: "Metrolinx and its assigns and successors in interest has or have a right-of-way within 300 metres from the land the subject hereof. There may be alterations to or expansions of the rail facilities on such right-of-way in the future including the possibility that Metrolinx or any railway entering into an agreement with Metrolinx to use the right-of-way or their assigns or successors as aforesaid may expand their operations, which expansion may affect the living environment of the residents in the vicinity, notwithstanding the inclusion of any noise and vibration attenuating measures in the design of the development and individual dwelling(s). Metrolinx will not be responsible for any complaints or claims rising from use of such facilities and/or operations on, over or under the aforesaid right-of-way.

The warning clause should be included in agreements that are registered on Title for all Offers of Purchase and Sale, lease/rental agreements, and condominium declarations.

2.3.4.3 Outdoor Living Areas (OLAs)

As shown in **Table 14**, the sound levels at the amenity terraces are predicted to be in exceedance of the 60 dBA criterion. As such, the outdoor living areas require the installation of noise control measures to achieve predicted levels to 55 dBA, or where not economically feasible, between 55 dBA and 60 dBA and a **Type B** warning clause **as outlined below.**

Type B Warning Clause: Purchasers/tenants are advised that despite the inclusion of noise control features in the development and within the building units, sound levels due to increasing road traffic (rail traffic) (air traffic) may on occasions interfere with some activities of the dwelling occupants as the sound levels exceed the sound level limits of the Municipality and the Ministry of the Environment.

Following MECP's NPC-300, mitigation in the form of acoustic barriers is recommended to reduce the exposure of the outdoor living areas to transportation noise. The following acoustic barriers are recommended to reduce the impacts at the OLAs:

- An acoustic barrier with a height of 2.0 m surrounding the 7th floor OLA of Tower 1; and
- An acoustic barrier with a height of 3.0 m surrounding the 5th floor OLA of Tower 2.

With the above recommended acoustic barriers, the amenity terraces of the proposed development are predicted to have transportation noise impacts between 55 dBA and 60 dBA. Achieving predicted transportation noise impacts of 55 dBA at the amenity terraces was found to not be feasible with acoustic barriers. Therefore, a Type B warning clause should be applied throughout the proposed development.

The locations and heights of the recommended acoustic barriers are presented in **Figure 4**. The acoustic barriers should have a minimum surface density of 20 kilograms per square metre (kg/m^2). The barriers should be structurally sound, appropriately designed to withstand wind and snow load, and constructed without cracks or surface gaps. Any gaps under the barrier that are necessary for drainage purposes should be minimized and localized, so that the acoustical performance of the barrier is maintained.

The predicted sound levels at the outdoor living areas with the assessed acoustic barrier mitigation are shown in **Table 16**.

Table 16: Transportation Noise Prediction Summary Table – OLA Impacts with Acoustic Barriers

Assessment Location	Daytime Equivalent Sound Level - L_{eq} 16-hr (dBA)
Tower 1 – 7th Floor OLA	58
Tower 2 – 5th Floor OLA	59

2.4 TNM Modelling Confirmation

Due to the magnitude of noise impacts from Highway 401 on the proposed development, confirmatory noise modelling was completed using STAMSON to demonstrate the accuracy of the TNM protocol. As STAMSON is not capable of incorporating the complex geometries and elevations of the sensitive receptors of the proposed development, the confirmatory modelling was performed on the first story of Building 4 at the closest building setback from the Highway 401.

The confirmatory modelling was completed only considering the Highway 401 noise source.

Table 17: TNM and STAMSON Confirmatory Modelling

Assessment Location	TNM Modelling Results	STAMSON Modelling Results
Tower 1 Level 6 South Facade	78.7 dBA	79.6 dBA

As the modelling results for TNM and STAMSON are demonstrated to be within an acceptable range of accuracy, the TNM modelling presented in this study should be considered acceptable.

The STAMSON model has been included in **Appendix D**.

2.5 Rail Vibration Assessment

The proposed development is located approximately 30 m from the CN York Subdivision right-of-way. As the proposed development is located within the vibration influence area of 75 m, per the Guidelines for New Development in Proximity to Railway Operations (The Federation of Canadian Municipalities and the Railway Association of Canada, 2013), a vibration assessment for the proposed development is required.

2.5.1 Vibration Criteria

There are no MECP guidelines with respect to railway vibration and proposed sensitive land-uses. Applicable guidelines for vibration impacts due to railway operations are those published in the Guidelines for New Development in Proximity to Railway Operations (The Federation of Canadian Municipalities and the Railway Association of Canada, 2013).

Overall vibration levels from railway activities are recommended not to exceed 0.14 millimetres per second (mm/s) root mean square (RMS) in the vertical direction between 4 Hertz (Hz) and 200 Hz, on and above the first floor of all dwellings. This criterion is based on the human perception of ground-borne vibration, published in the International Standard ISO 2631-2. Vibration levels from railway operations meeting this criterion will generally not be perceptible by the occupants.

2.5.2 Vibration Measurements

On December 3rd and 5th 2024, Dillon staff visited the site of the proposed development to conduct field ground vibration measurements at 30 m from the rail right-of-way. Measurements were completed for five freight train passbys. The Instantel Minimate was used for the field measurements. The instrument can measure peak particle velocity between 2 to 250 Hz. The vertical RMS was then calculated for all train passbys using an averaging time constant of 1 second.

Table 18 shows the calculated vertical RMS of the five train passbys.

Table 18: Rail Vibration Measurements

Date and Time of Rail Passby	Type of Train	Max Vertical RMS (mm/s)	Compliance with Criterion
03/12/24 12:23	Freight	0.054	Yes
03/12/24 12:38	Freight	0.058	Yes
05/12/24 10:50	Freight	0.057	Yes
05/12/24 12:13	Freight	0.050	Yes
05/12/24 13:45	Freight	0.046	Yes

The location of rail vibration measurements has been shown in **Figure 5**. Two vibration monitors were utilized for measurements. The results shown in **Table 18** represent the maximum vertical RMS calculated between each unit. The monitoring locations were changed between December 3rd and December 5th based on accessibility to the site. The measured ground vibration levels from train passbys were found to be below the applicable criteria. As such, mitigation measures are not predicted to be required.

3.0 Impacts from the Proposed Development on itself and the Environment

The mechanical equipment of the proposed development should be assessed for noise impacts on the proposed development itself and the surrounding environment. At the time of this assessment, the mechanical plans for the proposed development were not available.

The future mechanical equipment of the proposed development should be located to reduce exposure to the receptors of the proposed development and the surrounding environment and where possible should be located within mechanical penthouses. Where isolation from noise sensitive receptors is not possible, equipment selection should be completed with consideration for reducing the noise emissions of the equipment.

As mechanical plans become available for the proposed development, it is Dillon's recommendation that a qualified acoustic consultant assesses the stationary noise impacts of the equipment on the development itself and the surrounding environment.

4.0 Conclusions

Dillon Consulting Limited (Dillon) was retained by 1095 Kingston Road Ltd. C/O Resident to complete a noise and vibration assessment for a proposed development. This study has been completed in support of the submission application for the proposed development.

The noise assessment presented herein focuses on the noise impacts of nearby stationary noise sources and transportation corridors on the proposed development.

The noise assessment was prepared in accordance with the requirements of the Region of Durham and that of the Ontario Ministry of Environment, Conservation and Parks (MECP) noise publication NPC-300. Based on the results of the completed study, the following conclusions have been reached:

As outlined in **Section 2.1**, stationary noise impacts on the proposed development are predicted to be in compliance with applicable noise criteria.

As outlined in **Section 2.3**, transportation noise impacts on the proposed development can be sufficiently controlled by:

- The installation of central air conditioning with a Type D warning clause;
- Upgraded window glazing;
- Façade construction of brick veneer or an acoustical equivalent; and
- Installation of acoustic barriers with a Type B warning clause.

As outlined in **Section 2.5**, rail vibration impacts on the proposed development are predicted to be in compliance with applicable vibration criteria.

Due to the proximity to CN York Subdivision, CN Kingston Subdivision, and GO Transit Lakeshore East Subdivision, CN and Metrolinx require that warning clauses be applied to the proposed development.

As the design of the development progresses and building orientations, elevations, ground contours, and detailed building plans are finalized, this assessment should be updated by an Acoustic Consultant.

5.0 Closure

This noise and vibration assessment has been prepared based on the information provided and/or approved by 1095 Kingston Road Ltd. C/O Resident. This report is intended to provide a reasonable review of available information within an agreed work scope, schedule, and budget. This report was prepared by Dillon for the sole benefit of 1095 Kingston Road Ltd. C/O Resident. The material in the report reflects Dillon's judgement in light of the information available to Dillon at the time of this report preparation. Any use which a third party makes of this report, or any reliance on or decisions made based on it, are the responsibilities of such third parties. Dillon accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

We trust that the report is to your satisfaction. Please do not hesitate to contact the undersigned if you have any further questions on this report.

Respectfully Submitted:

Dillon Consulting Limited

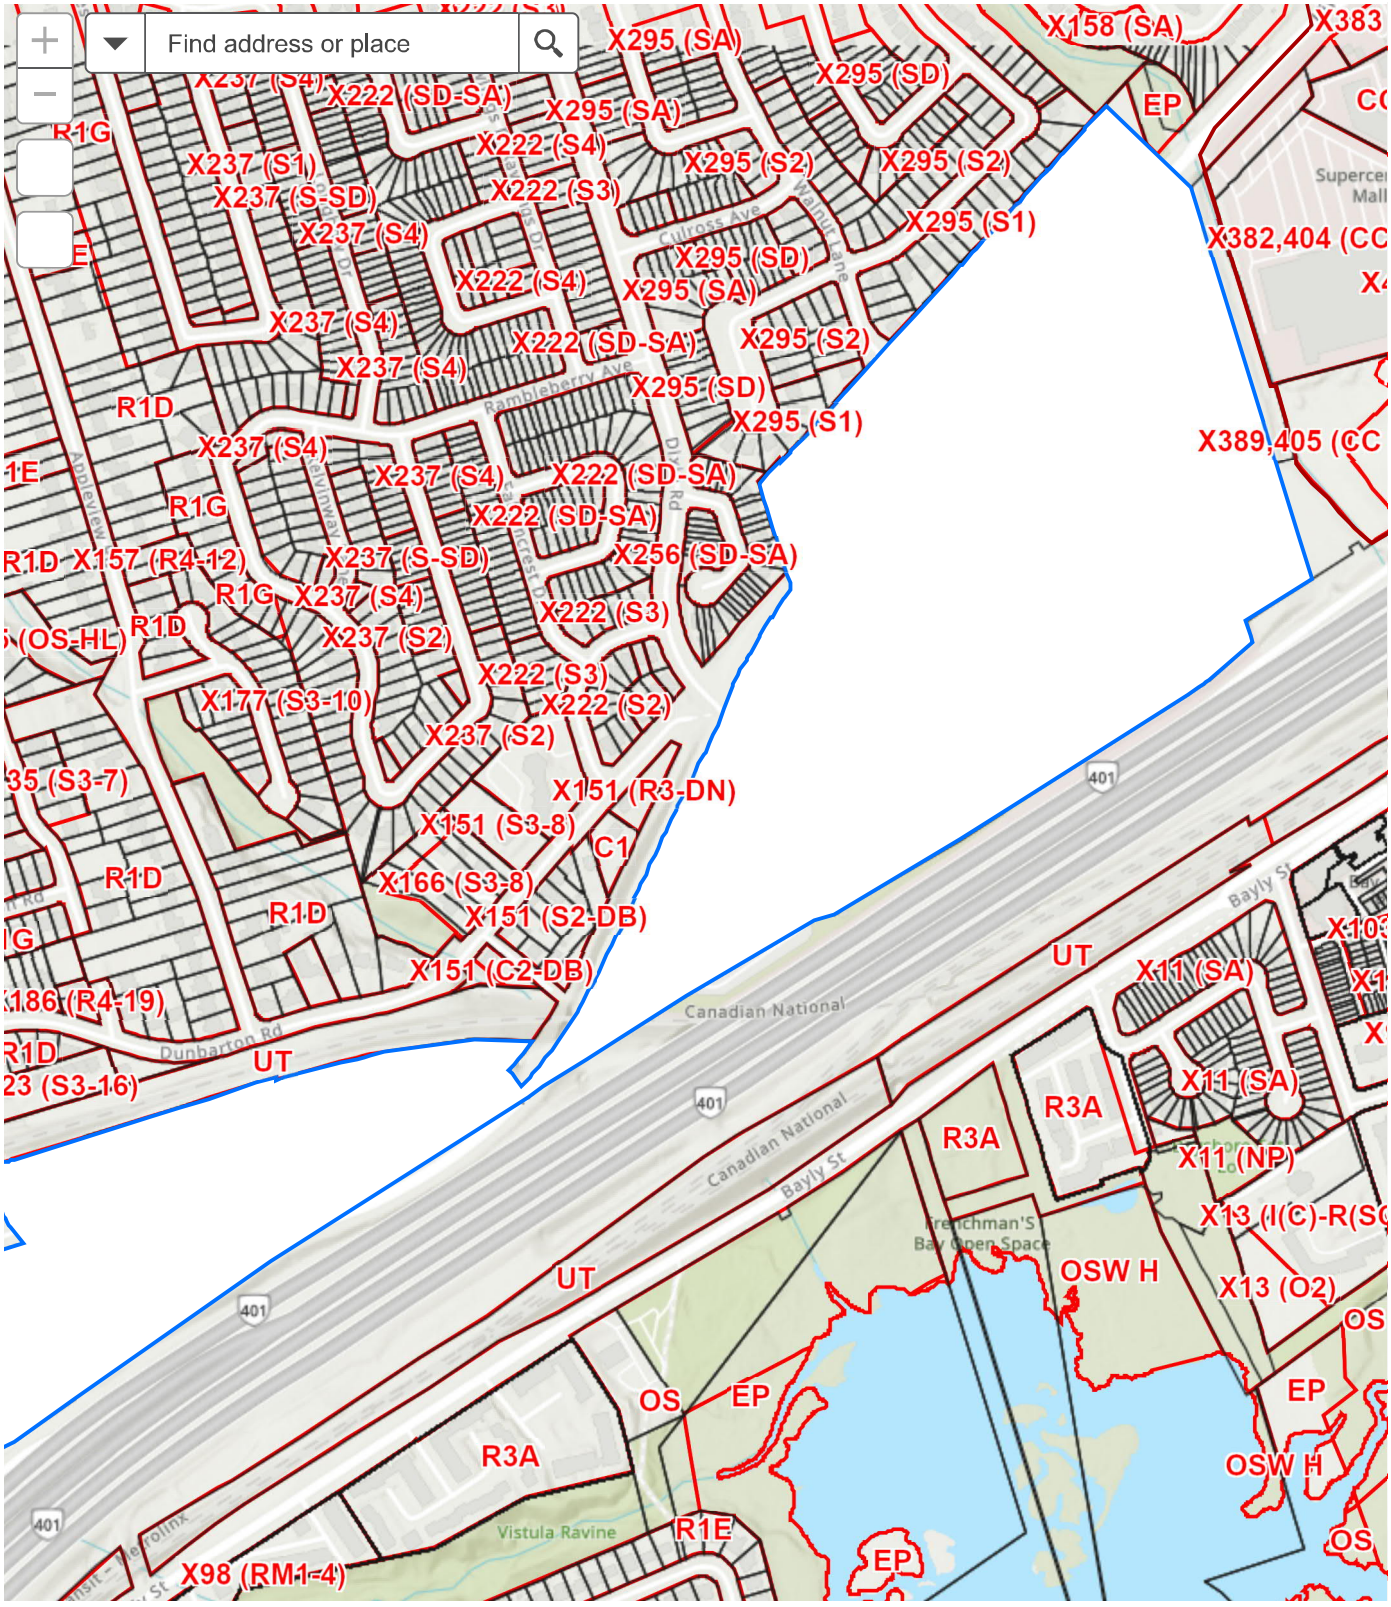
City of Pickering Zoning By-law Review



Appendix B

D-6 Classification Criteria

Category	Outputs	Scale	Process	Operations/Intensity	Possible Examples
Class I	• Noise: Sound not audible off property • Dust and/or Odour: Infrequent and not intense • Vibration: No ground borne vibration on plant property	• No outside storage • Small scale plant or scale is irrelevant in relation to all other criteria for this Class	• Self-contained plant or building which produces/stores a packaged product. Low probability of fugitive emissions	• Daytime operations only • Infrequent movement of products and/or heavy trucks	• Electronics manufacturing and repair • Furniture repair and refinishing • Beverages bottling • Auto parts supply • Packaging and crafting services • Distribution of dairy products • Laundry and linen supply
Class II	• Noise: Sound occasionally audible off property • Dust and/or Odour: Frequent and occasionally intense • Vibration: Possible groundborne vibration, but cannot be perceived off property	• Outside storage permitted • Medium level of production allowed	• Open process • Periodic outputs of minor annoyance • Low probability of fugitive emissions	• Shift operations permitted • Frequent movement of products and/or heavy trucks with the majority of movements during daytime hours	• Magazine printing • Paint spray booths • Metal command • Electrical production manufacturing • Manufacturing of dairy products • Dry cleaning services • Feed packing plant
Class III	• Noise: sound frequently audible off property • Dust and/or Odour: Persistent and/or intense • Vibration: Ground-borne vibration can frequently be perceived off property	• Outside storage of raw and finished products • Large production levels	• Open process • Frequent outputs of major annoyances • High probability of fugitive emissions	• Continuous movement of products and employees • Daily shift operations permitted	• Manufacturing of paint and varnish • Organic chemicals manufacturing • Breweries • Solvent recovery plants • Soaps and detergent manufacturing • Manufacturing of resins and costing • Metal manufacturing

Road traffic information request

2 messages

Heggart, Callum <cheggart@dillon.ca> Thu, Dec 12, 2024 at 10:18 AM
To: noiserequests@durham.ca

Hi,

I am completing a transportation noise study for a proposed development located at 1095 Kingston Road in Pickering Ontario.

Can you please provide the following information for Kingston Road in proximity to 1095 Kingston Road:

- Forecasted AADT and SADT
- Percentage of medium and heavy trucks

Please note that I have recently completed a study at 705 Kingston Road in Pickering and used the following information for Kingston Road. Please let me know if that data is valid for 1095 Kingston Road as well.

ROAD SEGMENT TRAFFIC FORECASTS FOR NOISE ANALYSES

This information is to be used as the basis for assessing the potential impacts of noise, generated by traffic on Provincial Highways and arterial roads, on proposed land uses that are sensitive (e.g., residential subdivisions). Arterial roads include existing and future Type A, B and C, as designated in the Durham Regional Official Plan.

Noise assessment reports recommend specific measures to be integrated into the design of sensitive developments to reduce road noise impacts to acceptable levels.

Hi Callum,

The data is the same at 705 and 1095 Kingston Road.

Thank you,

Anthony

The Regional Municipality of Durham

ROAD SEGMENT TRAFFIC FORECASTS FOR NOISE ANALYSES

This information is to be used as the basis for assessing the potential impacts of noise, generated by traffic on Provincial Highways and arterial roads, on proposed land uses that are sensitive (e.g., residential subdivisions). Arterial roads include existing and future Type A, B and C, as designated in the Durham Regional Official Plan.

Noise assessment reports recommend specific measures to be integrated into the design of sensitive developments to reduce road noise impacts to acceptable levels.

Hello Callie,

Please see attached hourly volume available for closet location at Highway 401 and study site. Unfortunately, MTO doesn't have vehicle classification counts.

In the year of 2021, The AADT was 267,400 and %Truck was 10%.

Thank you,

Sohil Patel, Traffic Analyst

Subject: Re: Road Traffic Information Request - 401

Good morning,

I would like to follow up on this request to ask additionally for the Summer Average Daily Traffic for the property noted above.

Thanks,

Callie

KNG-313.04- Liverpool Road, Pickering ON Rail Volume Information Request

Sarangan Srikanth <Sarangan.Srikanth@cn.ca> Tue, Oct 15, 2024 at 9:26 AM
To: "Airdrie, Callie" <cairdrie@dillon.ca>

Hi Callie,

The attached document is regarding your request for the Train Traffic Data for the following location: KNG-313.04- Liverpool Road, Pickering ON; this data does not reflect GO Metrolinx Traffic.

If you have any additional questions, please feel free to reach out to me.

Thank you,

Sarangan Srikanth

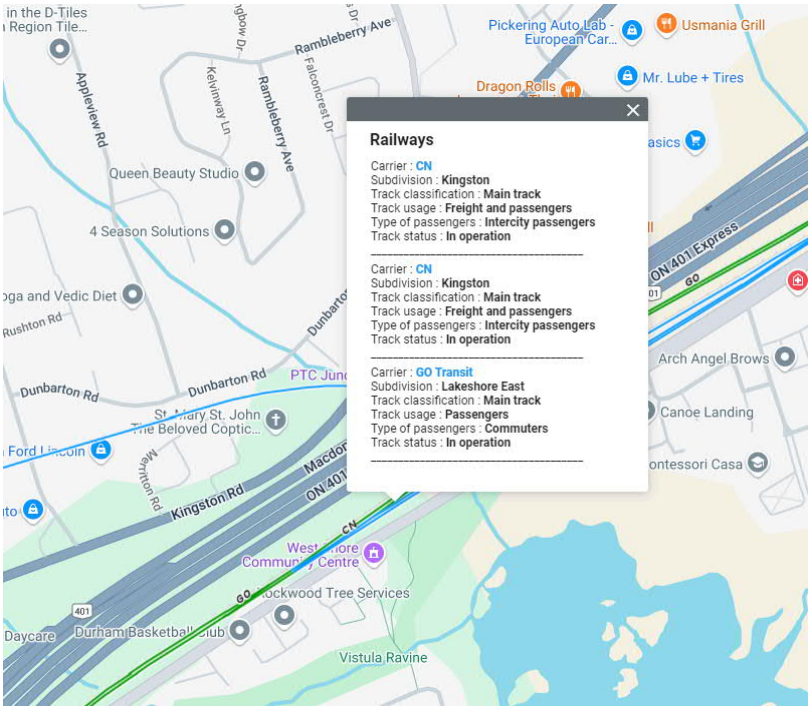
Subject: Rail Volume Information Request

Good morning,

I have been retained to complete a noise feasibility study for a proposed residential development in the city of Pickering. As the proposed development is in proximity to a CN rail line, I would like to request rail data for the purpose of noise modelling. The rail line I am interested in is pictured below (Kingston Subdivision).

Can you please provide rail traffic volumes and all relevant information to complete the noise study including speed, whistle activity, and track conditions?



Thanks,

Callie

Date: 2024/10/15 Project Number: KNG - 313.04 – Liverpool Road, Pickering ON

Dear Callie:

Re: Train Traffic Data – CN Kingston Subdivision near Liverpool Road in Pickering ON

The following is provided in response to Callie's 2023/02/17 request for information regarding rail traffic in the vicinity of Liverpool Road in Pickering, ON at approximately Mile 313.04 on CN's Kingston Subdivision.

Typical daily traffic volumes are recorded below. However, traffic volumes may fluctuate due to overall economic conditions, varying traffic demands, weather conditions, track maintenance programs, statutory holidays and traffic detours that when required may be heavy although temporary. For the purpose of noise and vibration reports, train volumes must be escalated by 2.5% per annum for a 10-year period.

Typical daily traffic volumes at this site location are as follows:

***Maximum train speed is given in Miles per Hour**

	0700-2300			
Type of Train	Volumes	Max.Consist	Max. Speed	Max. Power
Freight	12	140	65	4
Way Freight	0	25	65	4
Passenger	34	10	100	2

	2300-0700			
Type of Train	Volumes	Max.Consist	Max. Speed	Max. Power
Freight	5	140	65	4
Way Freight	4	25	65	4
Passenger	1	10	100	2

The volumes recorded reflect westbound and eastbound freight and passenger operations on CN's Kingston Subdivision.

Except where anti-whistling bylaws are in effect, engine-warning whistles and bells are normally sounded at all at-grade crossings. There are no at-grade crossing in the immediate vicinity of the study area. Please note that engine warning whistles may be sounded in cases of emergency, as a safety and or warning precaution at station locations and pedestrian crossings and occasionally for operating requirements.

With respect to equipment restrictions, the gross weight of the heaviest permissible car is 286,000 lbs.

The triple (3) mainline track is considered to be continuously welded rail throughout the study area. The presence of 4 switches located at Mile 313.02, 313.04, 313.12, and 313.13 may exacerbate the noise and vibration caused by train movements.

The Canadian National Railway continues to be strongly opposed to locating developments near railway facilities and rights-of-way due to potential safety and environmental conflicts. Development adjacent to the Railway Right-of-Way is not appropriate without sound impact mitigation measures to reduce the incompatibility. For confirmation of the applicable rail noise, vibration and safety standards, Adjacent Development, Canadian National Railway Properties at Proximity@cn.ca should be contacted directly.

I trust the above information will satisfy your current request.

Sincerely,

Sarangan Srikanth

Rail Information Request

Rail Data Requests <RailDataRequests@metrolinx.com> Fri, Nov 29, 2024 at 4:07 PM
To: "Heggart, Callum" <CHeggart@dillon.ca>

Hi Callum,

Further to your request dated November 29, 2024, the subject lands (1095 Kingston Road, Pickering) are located within 300 metres of the Metrolinx Kingston Subdivision (which carries Lakeshore East GO rail service).

It's anticipated that GO rail service on this Subdivision will be comprised of diesel and electric trains. The GO rail fleet combination on this Subdivision will consist of up to 1 locomotive and 5 passenger cars. The typical GO rail weekday train volume forecast near the subject lands, including both revenue and equipment trips is in the order of 324 trains. The planned detailed trip breakdown is listed below:

	1 Diesel Locomotive	1 Electric Locomotive		1 Diesel Locomotive	1 Electric Locomotive
Day (0700-2300)	64	213	Night (2300-0700)	10	37

The current track design speed near the subject lands is 100 mph (161 km/h).

There are no *anti-whistling by-laws* in affect near the subject lands.

With respect to future electrified rail service, Metrolinx is committed to finding the most sustainable solution for electrifying the GO rail network and we are currently working towards the next phase.

Options have been studied as part of the Transit Project Assessment Process (TPAP) for the GO Expansion program, currently in the Development Phase. ONxpress will be responsible for selecting and delivering the right trains and infrastructure to unlock the benefits of GO Expansion. Construction to support GO Expansion is currently underway.

However, we can advise that train noise is dominated by the powertrain at lower speeds and by the wheel- track interaction at higher speeds. Hence, the noise level and spectrum of electric trains is expected to be very similar at higher speeds, if not identical, to those of equivalent diesel trains.

Given the above considerations, it would be prudent at this time, for the purposes of acoustical analyses for development in proximity to Metrolinx corridors, to assume that the acoustical characteristics of electrified and diesel trains are equivalent. In light of the aforementioned information, acoustical models should employ diesel train parameters as the basis for analyses. We anticipate that additional information regarding specific operational parameters for electrified trains will become available in the future once the proponent team is selected.

Operational information is subject to change and may be influenced by, among other factors, service planning priorities, operational considerations, funding availability and passenger demand.

It should be noted that this information only pertains to Metrolinx rail service. It would be prudent to contact other rail operators in the area directly for rail traffic information pertaining to non-Metrolinx rail service.

I trust this information is useful. Should you have any questions or concerns, please do not hesitate to contact me.

Best Regards,

Jenna Auger (She/Her)

Subject: Rail Information Request

Hi,

I have been retained to complete a noise feasibility study for a proposed residential development located at 1095 Kingston Road in Pickering, Ontario. As the proposed development is in proximity to the Go Transit Lakeshore East Subdivision, I would like to request rail data for the purpose of noise modelling.

Can you please provide rail traffic volumes and all relevant information to complete the noise study including speed, whistle activity, and track conditions?

Thanks

Callum
